GPS UE BENCH TEST PLANS AND REQUIREMENTS

VOLUME 2

1.0 PURPOSE

The purpose of this report is to provide a basis for defining the hardware and software required to perform RF related bench tests of the Rockwell-Collins UE in the RF Laboratory of the GPS Central Engineering Activity at NAVAIRDEVCEN. For additional background information, see Volume 1.

1.1 SCOPE

This report contains general test requirements for each test defining the:

- level of test (UE, board, component),
- test objective (parameter/function),
- test inputs ,
- tests outputs ,
- equipment required for each input/output ,
- initial test procedure ,
- data reduction requirements ,
- summary list of test equipment (standard/special),
- block diagram of test .

Since most of these tests will be computer controlled, special software will be required to control the conditions, parameters and data collection needs of the test.

A section on special software requirements is provided which defines the software needs of each test in terms of flowcharts.

2.0 LIST OF REFERENCE DOCUMENTS

The following documents were used as references for UE RF configuration and performance requirements:

1. ICD-GPS-204	GPS Instrumentation and Connector Stds.	5 June 1981
2. SS-US-200	System Segment Specification	4 Nov. 1982
3. Collins	Engineering Drawings	23 Feb. 1982
4. Collins	Design Review	15 March 1982
5. Harris	GPS AE-1 LRU Performance Test Procedures	26 March 1982

3.0 TEST REQUIREMENTS

The test requirements contained herein deal with the Rockwell-Collins UE set and are written at the board level. Specific values of parameters, ranges, tolerances and granularities are provided if known. As more detailed information on the sets become available, missing values will be provided and the test requirements will be refined and expanded down to the component level.

3.1 ROCKWELL-COLLINS UE TEST REQUIREMENTS

This section contains the test requirements, procedures and block diagrams for board level testing of the Rockwell-Collins UE set. Initial functional test procedures have been compiled for the following boards or units:

1. Power Supply
2. RF Synthesizer
3. Correlator
4. IF Processor
5. Reference Oscillator
6. Antenna Electronics

Although information is available for these boards, there is not enough to completely identify board input and output levels for stimulation and measurement purposes. For example, some of the boards require digital input signals as stimuli. There is not enough information available to determine the required input levels for these signals or the levels for output signals. These digital signals also present a problem in that special purpose hardware may be required to interface the test equipment to the board being tested. This problem will be discussed further in Volume 3, Section 5.0 (Special Purpose Hardware Requirements).

No information has been located concerning Rockwell-Collins Preamplifier Unit. Test requirements for this unit will be provided as information becomes available.

3.1.1 Rockwell-Collins Test Procedures

The following sheets contain the initial test requirements and procedures as listed in Section 1.1 for each of the boards identified in Section 3.1. These sheets will be refined and expanded as more information becomes available. Also as more detailed data on the boards becomes available sheets will be added for testing to the component level.

3.1.1.1 POWER SUPPLY MODULE

Contractor: Rockwell-Collins
Board Tested: Power Supply
Test Objective: Measure DC output voltages.

Inputs

	<u>Input Name</u>	<u>Input Level</u>	<u>Equipment Used</u>
1.	<u>AC or DC input</u>	<u>115V 400MHz(AC) or 160VDC</u>	<u>External Source</u>
2.	<u>(1/100) F₀</u>	<u>102,300Hz @ TBD</u>	<u>Function Generator (HP-8116A)</u>

3.	<u></u>	<u></u>	<u></u>
4.	<u></u>	<u></u>	<u></u>
5.	<u></u>	<u></u>	<u></u>

Test Procedure: Turn on test equipment. Set measurement equipment
proper ranges. Apply proper signal levels to all inputs. Measure DC
voltage with Digital Multimeter. An Oscilloscope will be used to check
for ripple. (This will be repeated for all DC outputs).

Data Reduction: Send input level and output of Digital Multimeter to
printer. Output of Oscilloscope to plotter.

Test Procedure: Hook up unit test as shown in schematic. Turn on
test equipment. Set measurement equipment to proper ranges. Apply
proper signal levels to inputs of synthesizer board. Measure signal
level of Control Signals with DMM. Observe signal presence and level
with scope.

Data Reduction: Send input levels and output of Digital Multimeter
to printer. Output of Oscilloscope to plotter.

Test Procedure: Hook up unit under test as shown in schematic. Turn
on test equipment. Set measurement equipment to proper ranges. Apply
proper signal levels to inputs of synthesizer board. Measure the
spectral content of the (¹³⁷/₁₆)Fo output with the Spectrum Analyzer
checking for spurious outputs, harmonic levels, frequency stability etc.

Data Reduction: Send input levels to printer. Output of Spectrum
Analyzer to plotter.

3.1.1.6 ANTENNA ELECTRONICS

Contractor: Rockwell-Collins

Board Tested: Antenna Electronics

Test Objective: To ensure that the L1 and L2 IF interfaces of the
AE are AC coupled (DC Impedance)

Inputs

	<u>Input Name</u>	<u>Input Level</u>	<u>Equipment Used</u>
1.	<u>Digital Controls</u>	<u>TBD</u>	<u>TBD</u>
2.	<u>---</u>	<u>---</u>	<u>---</u>

Test Procedure: Turn on test equipment. Set measurement equipment
to proper ranges. A 0dBm CW signal will be injected for five
minutes alternatively into each of the CRPA inputs as well as the BMFRPA
input. This will be repeated using a +30dBm peak power pulse signal with
4 μ s pulse width and 0.1% duty cycle for five minutes. The tests performed
for GAIN and Noise Figure will be repeated. Repeat procedure for L2
frequency.

Data Reduction: Send input levels and output of Power Meter to printer.
Compare results with data obtained in test performed for GAIN & NOISE
FIGURE to verify no damage to AE.

5.	<u>IF output</u>	<u>2 ns max.</u>	<u></u>

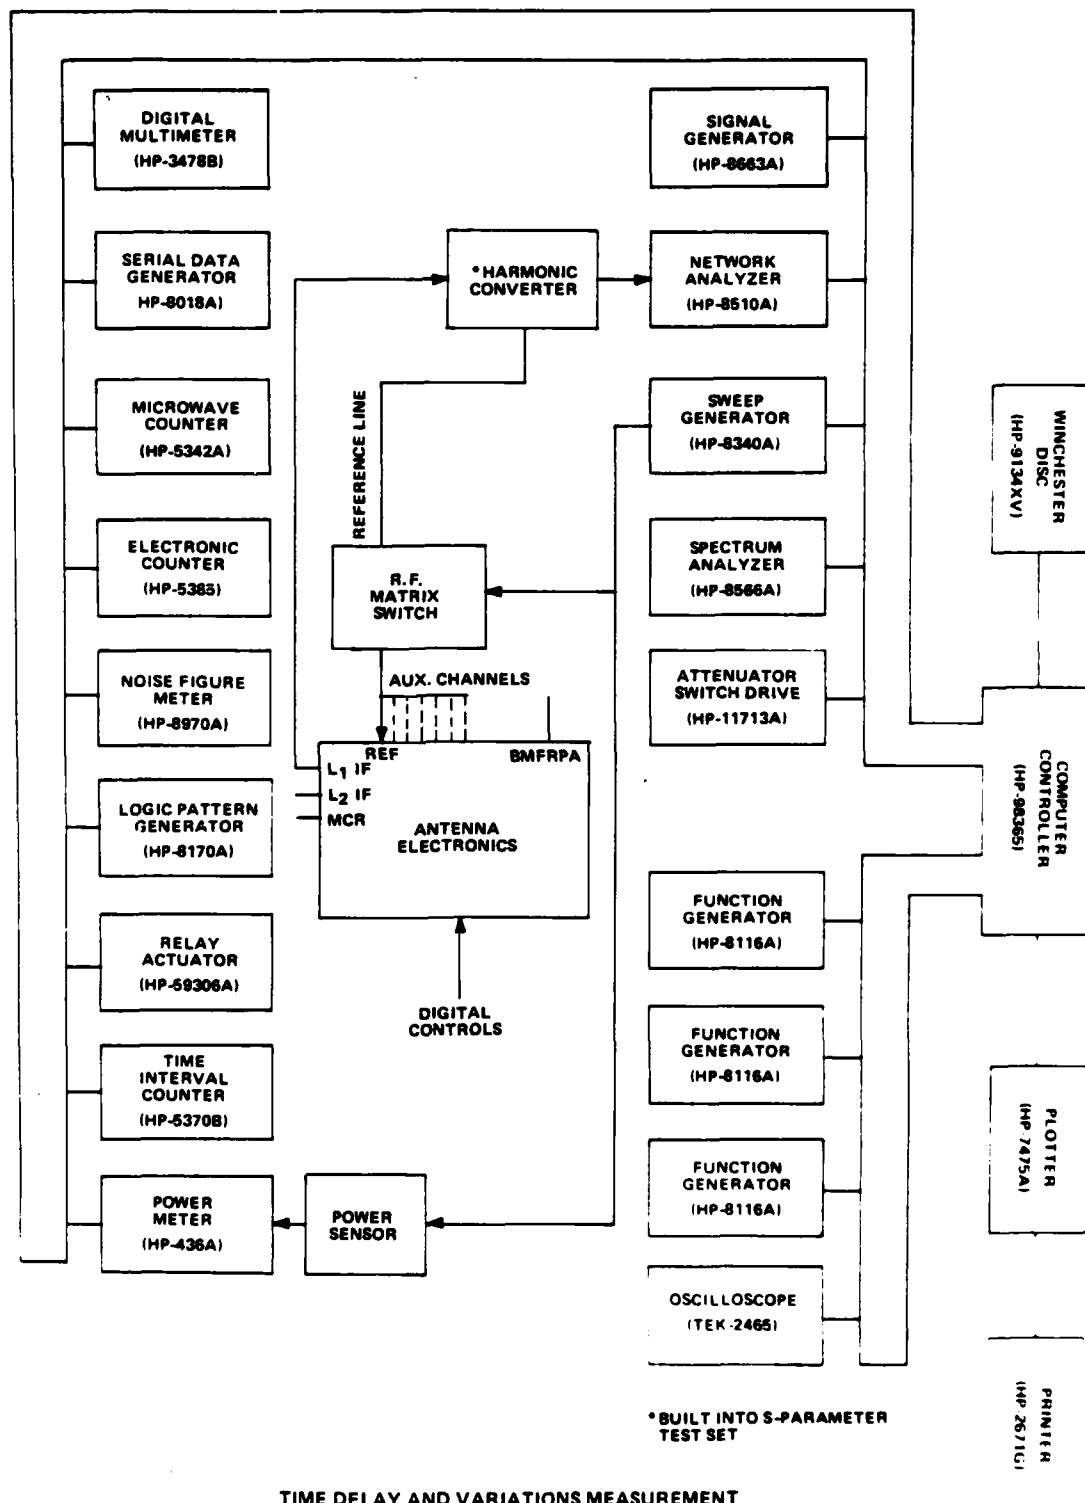

Test Procedure: Turn on test equipment. Set measurement equipment
to proper ranges. Connect the sweep generator to the reference channel
input of the AE and the L1 IF output to the test input of the harmonic
converter*. The reference input of the harmonic converter will be connected
to the sweep generator by a calibrated line length. The HP-8510 display
should show a flat phase slope. The sweep generator will be switched to
each of the auxiliary channels and the phase slope will be observed. This
will be repeated for L2 as well as for the MCR output. The Phase slope
will be measured with the sweep gen. connected to the BMFRPA at both L1 & L2.

Data Reduction: Send output of Network Analyzer to plotter and
send inputs to printer. Time delay will be calculated from phase slope
recording by the 8510 display.

Test Procedure: Turn on test equipment. Set measurement equipment
to proper ranges. The sequence of events will be demonstrated using an
Oscilloscope connected to the LRU Status Line.

Data Reduction: Send input levels to printer and output of Oscilloscope to plotter.

4.0 SOFTWARE REQUIREMENTS

This section contains the software requirements for the bench test procedures defined in Section 3. These software requirements are defined in terms of flowcharts.

The software requirements contained herein are written at the functional level. There is a flowchart for each test procedure that illustrates the sequence of events that will be required in order to perform these tests by computer. In addition to these requirements, all tests will include the following:

- o menu driven testing will prompt operator through:
 - 1. test set-ups
 - 2. testing
 - 3. data reduction/storage/hardcopy
- o Each test will have a program module number and will be contained in a testing menu. All tests with the same set-up can be grouped together to be run one after the other.
- o Each test will incorporate a full error-checking capability during operator inputs so that no manual error can be entered into the system.
- o Data reduction based on baseline data and/or range limits. The specified range values and/or tolerance will be stored and compared to the results obtained from the actual test. The values will be displayed and any differences can quickly be seen.
- o There will be real-time monitoring for any bus available information during testing.
- o There will be off-line storage or transfer of data for interfacing with the DPSSF/NSL system capabilities. This capability will be used for any information that is needed for the DPSSF, NSL or RFL.

- o All software will be stored including back-up disks and hardcopy listings, in a library which will contain as a minimum, the following information in its catalog:

1. program module name and number (disk #)
2. back-up copy # (disk #)
3. data written, by whom
4. date last revised, by whom

There are two floppy disk drives which have a memory of 170k each built into the computer. All information will be stored on either of these floppy disks. There is also a Winchester hard disk provided. This can be used as a temporary storage for data and information obtained while testing, if needed. For example, if a series of tests are being run and many data points are needed to be stored and all of the memory is being used in the computer, the information is stored temporarily on the Winchester disk until processing is complete and then archived onto the floppy disks.

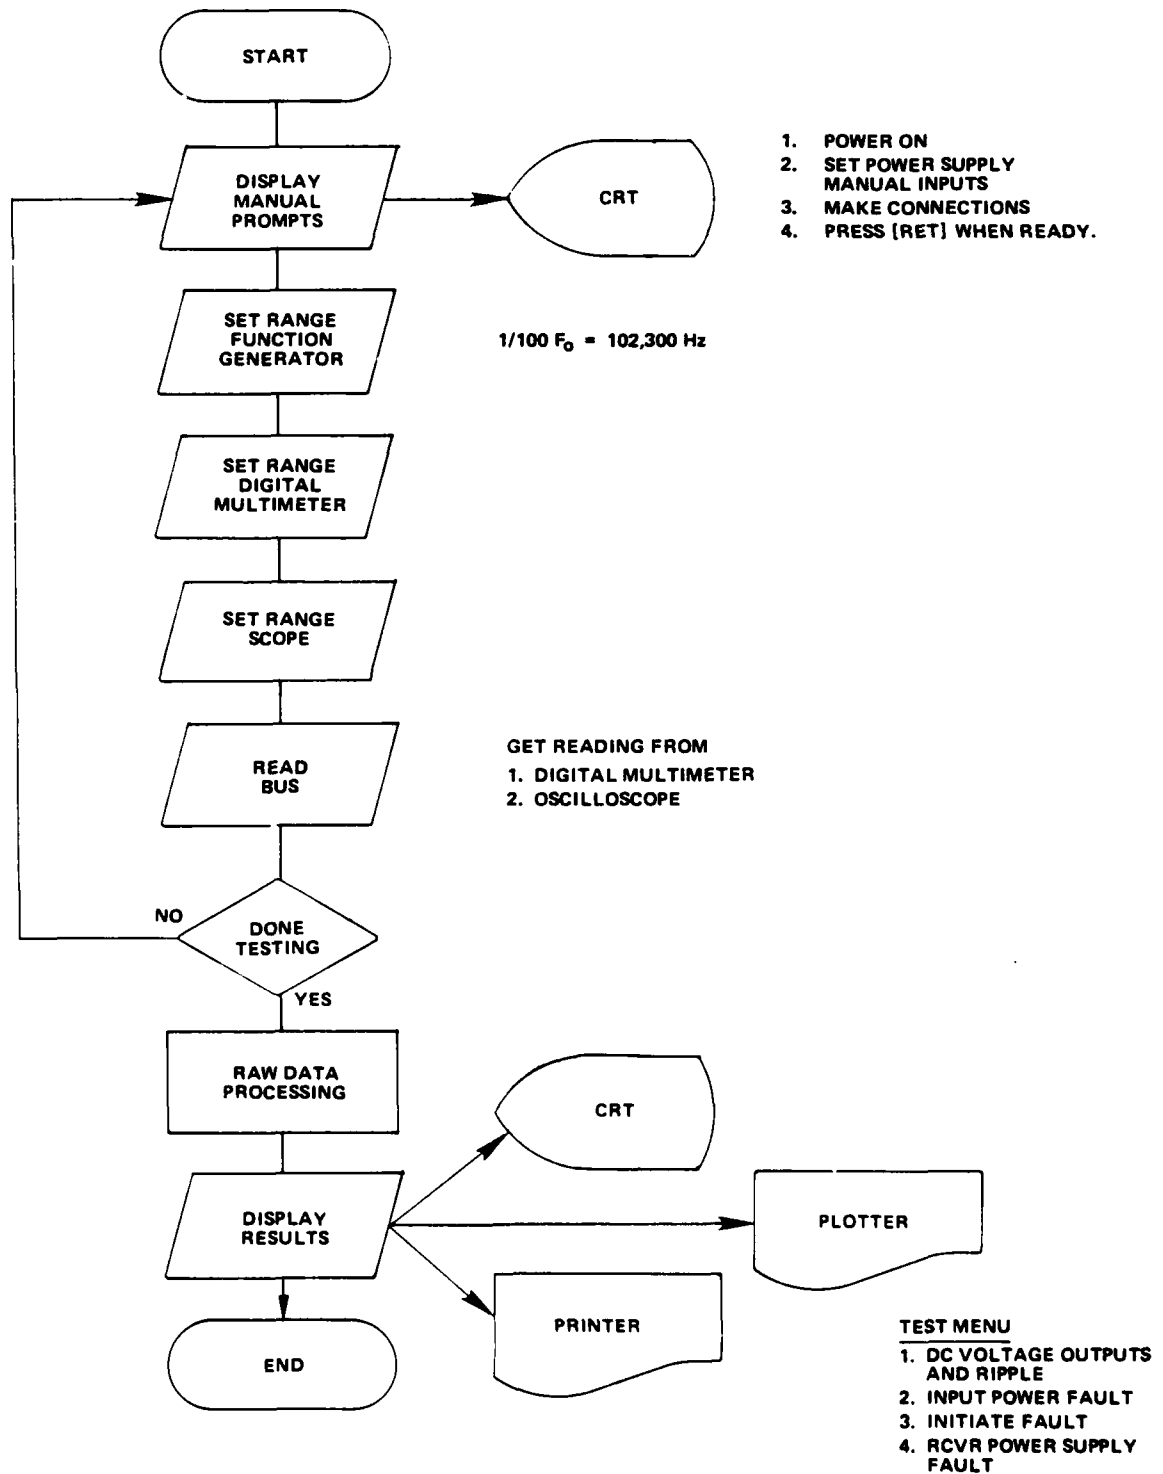

4.1 ROCKWELL-COLLINS SOFTWARE REQUIREMENTS

The following sheets contain the software requirements for the Bench Test Procedures for each of the boards identified in section 3.1. The software requirements will also be refined and expanded as more detailed information becomes available for the bench tests.
